

SERCOM Process computer

Tailor-made automation

Sercom supplies practical solutions for automating the process control for every type of greenhouse or storage areas. Sercom provides computers for both small and large horticultural companies. The precision and speed at which processes, like the PAR light control, humidifying or the screening systems, can be controlled are unique. With the Sercom process computer you get the best out of your technical installations.

Expansion
easy and
possible

Remote
control

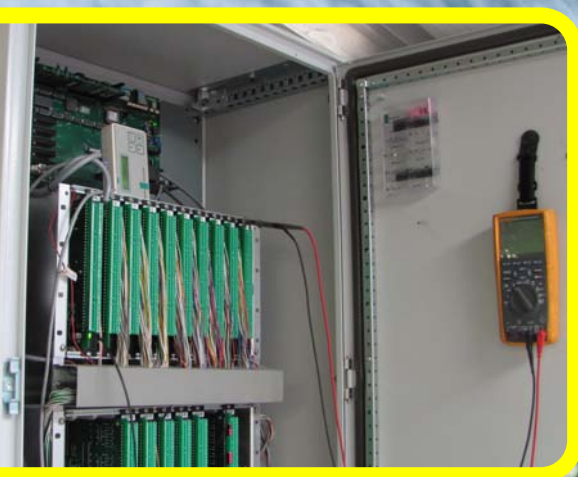

Robust and
dirt-resistant

Well-
designed
cabling

Tailor-made
solution

Practical
software and
very precise
control

The process computers from Sercom have a modular design. The casing is robust, and the LCD-control panel can be installed in the door or at a distance. This allows the computer to be operated from any place in your company. The number of inputs and outputs for measurement and guidance signals can be individually configured, allowing you to control precisely those processes that are relevant for your situation. Sercom places a high priority on an efficient cabling.

Together with your engineer, you can design the optimal business configuration. Thanks to the modular design of our systems, expansion in the future is always possible and easy.
