

Wireless RS485 Xtender

Wireless connection within 5 kilometres

After the introduction of the Wireless Xtender, with which a wireless connection can be made between the climate computer and individual field stations, we continued this development with the development of a system which enables a wireless connection between the process computer and the control PC.

This print can easily be connected to the control PC or laptop in the office, where the same print can be placed in the process computer on location. After this, a connection is automatically made between the two locations and it is possible to monitor and operate the climate computer within a distance of 5 kilometres.

This technology, which, like the Wireless Xtender, is based on radio waves, can be applied to any other system or device that works with an RS485 cable connection as standard.

In brief:

- Connects process computer to control PC
- Wireless connection within 5 kilometres
- Suitable for any other RS485 connection
- Automatic data format recognition and setting
- Plug & Play
